

MEDIA RELEASE

ASTA Announces 2023 National Science Week Theme

Australian Science Teachers Association (ASTA) is pleased to confirm that in 2023, the National Science Week theme will be Innovation: Powering Future Industries.

This theme will incorporate the advancement in technology in all industries, especially using artificial intelligence (AI). This will involve the application and intersection between science and technology, making it appealing to STEM learning.

ASTA's President, Rosemary Anderson, notes that innovation is driving new ways of approaching our future development. Encompassing topics of interest such as Medicine, Marine Research, Agriculture, Climate Change and Mining, the theme touches almost every aspect of humanity's progress.

"Innovation is an accessible topic that is versatile," says Ms Anderson. "All years can engage with the theme of Innovation, exploring its growth and how a variety of industries have advanced the use of AI."

As a school's theme for National Science Week, students might investigate topics such as AI in major industries, advancements in renewable energies and data science, and the use of technologies to detect environmental changes.

National Science Week occurs in August each year.
